## Projects

### 1. WorldieChat [Visit Site](#)

This is a chat application that connects users from all over the world. Users can send and receive messages in realtime. On the frontend, users can change color themes between three available themes. The application includes user authentication. It was built using:

- ReactJS
- Styled Components: This styling library helps to write styles in JavaScript. I also used it to implement theming and theme switching on the app.
- Firebase: This is a backend service which I used to power the backend of the application. It was also used for user authentication.

### 2. Shortly URL Shortener [Visit Site](#)

This is a custom URL Shortener application that shortens long and messy URL's. It does this through interaction with the shortcode API. It was built with ReactJS.

### 3. GitHub User Search [Visit Site](#)

This application gets and displays information about a user's GitHub profile. It gets all the data from the GitHub Users API. It was built with ReactJS.
